

# The Various Methods to Biopsy the Lung

---

PROF SHITRIT DAVID

HEAD, PULMONARY DEPARTMENT

MEIR MEDICAL CENTER, ISRAEL

# Conflict of Interest

---

This presentation is supported by AstraZeneca

# Two main steps before treatment

---

Tissue Diagnosis

Staging

# Bronchoscopy

---

Easy to perform as an outpatient procedure

Moderate Sedation

Risk of complications is minimal

# Bronchoscopy: modalities

---

- BAL
- Brushing
- Cytology
- Biopsy
  - Endobronchial (EBB)
  - Transbronchial (TBB)
  - Cryobiopsy

## Bronchoscopy and Needle Biopsy

### Bronchoscopic diagnostic and staging techniques

Bronchoscopic biopsy of lesion in left lower lobe

Brush cytologic investigation of lesion obstructing bronchus

Transbronchial needle biopsy of subcarinal lymph node

### Percutaneous transthoracic needle biopsy

Large bore (18-gauge) needle inserted through chest wall and used as guide sheath for 22-gauge biopsy needle. Biopsy needle attached to syringe and inserted into tumor with short jabs

# Pleural effusion

---

- Pleural aspiration
- Pleural biopsy
  - US/CT Guided
  - Thoracoscopy
  - (with or without pleurodesis)

# Invasive Mediastinal Staging

- Mediastinoscopy
- Anterior Mediastinotomy

# Minimally Invasive Mediastinal Staging

- Endobronchial  
Ultrasound  
**EBUS**

- Endoscopic  
Ultrasound  
**EUS**

## EBUS – Endobronchial Ultrasound Linear (Convex ) and Radial

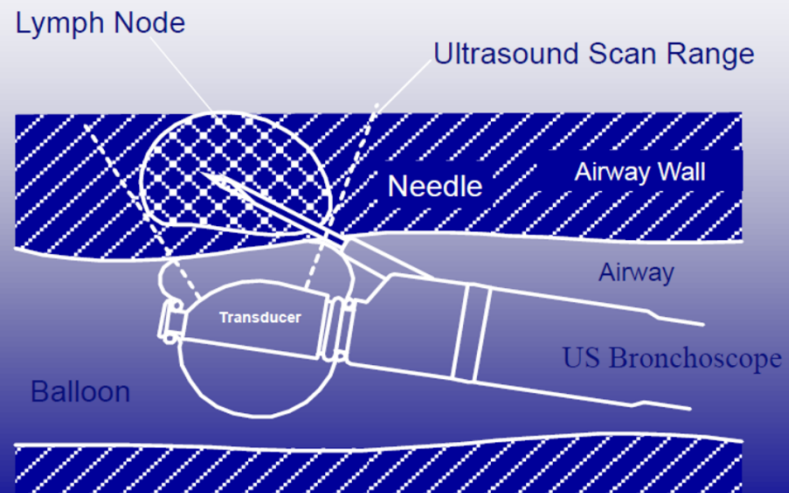

---

## What is the EBUS?

## EBUS-TBNA Principle

# EBUS

# Bronchoscopy suite

---

# Lymph nodes stations for EBUS

## Superior mediastinal nodes

- 1 Highest mediastinal
- 2 Upper paratracheal
- 3 Prevascular and retrotracheal
- 4 Lower paratracheal (including azygos nodes)

N2 = single digit, ipsilateral

N3 = single digit, contralateral or suprastavicular

## Aortic nodes

- 5 Subaortic (A-P window)
- 6 Para-aortic (ascending aorta or phrenic)

## Inferior mediastinal nodes

- 7 Subcarinal
- 8 Para-oesophageal (below carina)
- 9 Pulmonary ligament

## N1 nodes

- 10 Hilar
- 11 Interlobar
- 12 Lobar
- 13 Segmental
- 14 Subsegmental

# Lymph node

- 4R and SVC

## Indications for EBUS in lung cancer

---

- ❖ Diagnosis of lung cancer
- ❖ Staging of lung cancer
- ❖ Re-staging after neoadjuvant therapy
- ❖ Recurrence of lung cancer
- ❖ To obtain more specimen for molecular testing
- ❖ To diagnose lung metastasis from other known primary cancer

# What should be the first modality for LN Staging?

---

- ❖ The ACCP Guidelines for Lung Cancer recommended EBUS as first-line approached for invasive mediastinal staging of NSCLC.

# Why EBUS and not Mediastinoscopy?

---

Surgery!

Complication rate 1-2.6%

Mortality 0.08%

Very difficult after the first procedure.

No option to reach hilar adenopathy (10,11,12 stations).

# What is the benefit of EBUS?

---

Minimally invasive

Outpatient procedure

Same benefit in elderly (above 75 yrs old) patients.

**ROSE**-Rapid Onsite Evaluation

**The EBUS is indicated in every case of unexplained mediastinal lymphadenopathy.**

**Diagnosis and staging of lung cancer**

# EBUS-TBNA Systematic Review and Meta-analysis

- 10 studies (n=817)
- **Sensitivity = 0.88** (95%CI, 0.79-0.94), **Specificity = 1.00** (95%CI, 0.92-1.00)

**Table 1** Study characteristics

Paper	Eligible patients (n)	Patient population	Inclusion criteria
Okamoto (2002) <sup>18</sup>	37	Suspected lung cancer	ND
Yasufuku (2005) <sup>15</sup>	108	Known/suspected lung cancer	CT mediastinal lymph nodes >1 cm on short axis
Rintoul (2005) <sup>16</sup>	20	Known/suspected lung cancer	CT mediastinal lymph nodes >1 cm on short axis
Yasufuku (2006) <sup>17</sup>	102	Known/suspected lung cancer	Stage I–IIIa
Plat (2006) <sup>19</sup>	33	Suspected lung cancer	PET positive mediastinal lymph nodes
Pierard (2006) <sup>19</sup>	51	Suspected lung cancer	PET positive mediastinal lymph nodes
Herth (2006) <sup>13</sup>	100	Known NSCLC	CT mediastinal lymph nodes <1 cm on short axis
Yasufuku (2007) <sup>12</sup>	45	Known/suspected lung cancer	Operable disease
Skwarski (2007) <sup>14</sup>	300	Known/suspected lung cancer	ND
Annema (2007) <sup>11</sup>	21	Known NSCLC	ND

ND, not described; NSCLC, non-small cell lung cancer; PET, positron emission tomography.

*Adams et al. Thorax; 2009; 64: 757-62*

# EBUS vs. MED

TABLE 1. Diagnostic Yield of EBUS-TBNA and Mediastinoscopy in the Evaluation of Mediastinal Lymph Nodes

	Lymph Node Size in mm: Mean $\pm$ SD (Range)	EBUS Yield (%)	Mediastinoscopy Yield (%)	<i>p</i> <sup>a</sup>
All lymph nodes	15 $\pm$ 2.6 (10–21)	109/120 (91)	94/120 (78)	0.007
Lymph node station				
2 all	16 $\pm$ 3.1 (10–21)	24/25 (96)	22/25 (88)	0.30
2 right	18 $\pm$ 1.6 (14–20)	12/13 (92)	11/13 (85)	0.99
2 left	14 $\pm$ 3.6 (10–21)	12/12 (100)	11/12 (92)	0.99
4 all	15 $\pm$ 2.6 (10–19)	45/54 (83)	40/54 (74)	0.24
4 right	15 $\pm$ 2.6 (10–19)	29/34 (85)	24/34 (71)	0.14
4 left	15 $\pm$ 2.6 (10–19)	16/20 (80)	16/20 (80)	0.99
7	15 $\pm$ 2.4 (10–19)	40/41 (98)	32/41 (78)	0.007
Pathology				
Malignant	16 $\pm$ 2.7 (10–21)	64/74 (86)	49/74 (66)	0.004
Benign	15 $\pm$ 2.5 (10–21)	45/46 (98)	45/46 (98)	0.99

Ernst et al, J Thorac Oncol 2008; 3: 577

# How to do the Staging examination?

---

# Case 1: Adenocarcinoma (Lung)

## Case 2: CT

---

# Case 2: PET

# Case 2: EBUS- Lymph node station 5

---

A few atypical cells (positive for 5/6 and p63 immunostains) present in a background of lymphocytes and reactive respiratory cells (CK 7 positive), **consistent with metastasis of squamous cell carcinoma.**

## EBUS GUIDED FNA OF CENTRAL PARATRACHEAL LESIONS

# Radial US

# How many aspirations?

Table 2—Cumulative Diagnostic Values of EBUS-TBNA Shown by the Number of Aspirations\*

Variables	Aspirations, No.			
	1	2	3	4
Sensitivity	69.8 (30/43)	83.7 (36/43)	95.3 (41/43)	95.3 (41/43)
Specificity	100 (83/83)	100 (83/83)	100 (83/83)	100 (83/83)
PPV	100 (30/30)	100 (36/36)	100 (41/41)	100 (41/41)
NPV	86.5 (83/96)	92.2 (83/90)	97.6 (83/85)	97.6 (83/85)
Accuracy	89.7 (113/126)	94.4 (119/126)	98.4 (124/126)	98.4 (124/126)

\*Data are presented as % (No./total). We considered inadequate samples as negative results.

- “Pass” or “Aspiration”: the needle is inserted in the LN, agitated several times, and removed
- Yield plateaus after 3 passes

Lee HS *et al.* CHEST 2008; 134:368–374

# FNA technique: Hitting the node

---

- Always send to **cell block**
- Estimation of 50-100 cells in every aspiration
- The 19 and the 21-gauge needle resulted in better preservation of histologic structure.
- The needle has to move inside the node.
- Sample the node from capsule to capsule.
- Sample different areas of the node .

Lee H, Chest 2008; 134: 368-374

# The typical features of benign nodes

---

- ❖ Oval shape
- ❖ Size <1 cm
- ❖ Indistinct margin
- ❖ Presence of a central hilar structure
- ❖ Relatively high echogenicity
- ❖ Homogenous echogenicity.

# Common features of malignant nodes

---

- ❖ Round shape
- ❖ Size >1 cm
- ❖ Distinct margin
- ❖ Absence of the central hilum
- ❖ Eccentric cortical thickening
- ❖ Relatively low echogenicity
- ❖ Heterogeneous echogenicity
- ❖ Presence of necrosis
- ❖ Increased vascularity in lymph nodes

# Rapid On Site Evaluation

---

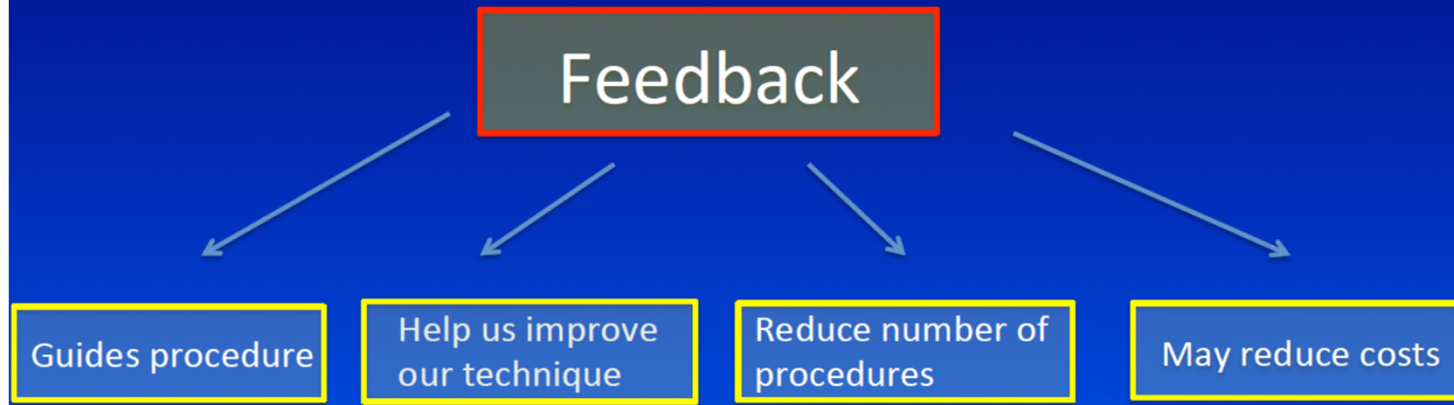

# With or without ROSE?

Reference	Study design	Population	Intervention	Comparator	Primary objective (endpoint)	Outcome	Quality metric indicator
Trisolini [47] 2011	Prospective, experimental RCT	Enlarged mediastinal or hilar LN (n = 168)	TBNA + ROSE (n = 83)	TBNA (n = 85)	Diagnostic yield; secondary: biopsy sites	<u>Yield: 78 vs. 75% (NS);</u> adequate sample 78 vs. 87% (NS); number of TBB (IQR) 1 vs. 2 (p < 0.001); complication rate 6 vs. 20% (p < 0.05)	Good
Yarmus [48] 2011	Prospective, experimental RCT	Enlarged mediastinal or hilar LN (n = 68)	TBNA + ROSE (n = 34)	TBNA (n = 34)	Diagnostic yield; secondary: number of needle passes and procedure time	<u>Yield: 55 vs. 53% (NS);</u> adequate sample 94 vs. 88% (NS); number of needle passes 4 vs. 4 (NS); number of TBB (NS); procedure duration time and amount of sedatives needed (NS); complication rate not reported; study was powered to detect differences in yield >30%	Fair
Okai [49] 2013	Prospective, experimental RCT	Enlarged mediastinal or hilar LN + (suspected) lung cancer (n = 120)	EBUS + ROSE (n = 55)	EBUS (n = 53)	Number of additional procedures	Additional procedures 11 vs. 57% (p < 0.001); number of aspirations 2.2 vs. 3.1 (p < 0.001; in non-ROSE group predetermined to 3); procedure time 22.3 vs. 22.1 min (NS); <u>sensitivity 88 vs. 86% (NS);</u> accuracy 89 vs. 89% (NS)	Good

- No good quality data (RCT) on EBUS +/-ROSE, mostly for standard TBNA +/- ROSE

# Role for ROSE?

A. In experienced hands, mediastinal staging could be performed under moderate sedation without decreasing diagnostic yield

## ORIGINAL ARTICLE

### Randomized Trial of Endobronchial Ultrasound–guided Transbronchial Needle Aspiration under General Anesthesia versus Moderate Sedation

Roberto F. Casal<sup>1,2</sup>, Donald R. Lazarus<sup>1</sup>, Kristine Kuhl<sup>3</sup>, Graciela Nogueras-González<sup>4</sup>, Sarah Perusich<sup>2</sup>, Linda K. Green<sup>1,5</sup>, David E. Ost<sup>6</sup>, Mona Sarkiss<sup>7</sup>, Carlos A. Jimenez<sup>8</sup>, Georgie A. Eapen<sup>6</sup>, Rodolfo C. Morice<sup>6</sup>, Lorraine Cornwell<sup>1,8</sup>, Sheila Austria<sup>9</sup>, Amir Sharafkanneh<sup>1,2</sup>, Rolando E. Rumbaut<sup>1,2</sup>, Horia Grosu<sup>6</sup>, and Farrah Kheradmand<sup>1,2</sup>

- RCT, EBUS under MS vs. GA (1:1 randomization)
- Adults referred for EBUS-TBNA of hilar/mediastinal LN or masses
- Cytologist blinded to randomization
- 1<sup>st</sup> Outcome: Diagnostic yield
- 2<sup>nd</sup> Outcomes: sensitivity, sample adequacy, procedure time, procedure completion rates, complication rates, escalation of care, tolerance

Am J Respir Crit Care Med Vol 191, Iss 7, pp 796–803, Apr 1, 2015

# EBUS also for Molecular Testing?

---

- Retrospective analysis of 209 cytology specimens from patients with lung cancer MD Anderson
  - 99 EBUS samples
  - 67 TTNA samples
  - 27 body fluid
  - 10 US-guided FNA superficial sites
- DNA sequencing for EGFR and KRAS performed all specimens
- Overall specimen insufficiency rate was low: 6.2%
  - EBUS: 4%
  - TTNA: 5%
  - Body fluid: 1%
  - US-guided superficial FNA: 1%

Billah S, et al. Cancer Cytopathol. 2011; 119(2):111-117

# The Efficacy of EBUS-Guided Transbronchial Needle Aspiration for Molecular Testing in Lung Adenocarcinoma

(Ann Thorac Surg 2013;96:1196–202)

*Table 3. Molecular Analysis of Tested Samples*

Sample Type	No. of Samples Tested	Positive (%)	Negative (%)	Insufficient (%)	Sufficient for Testing
EGFR	51	5 (10%)	41 (80%)	5 (10%)	46 (90%)
ALK	43	5 (12%)	34 (79%)	4 (9%)	39 (91%)
Kras	40	10 (25%)	20 (50%)	10 (25%)	30 (75%)

Numbers in parentheses represent proportion in total number of samples tested.

ALK = anaplastic lymphoma; EGFR = epidermal growth factor receptor; Kras = Kirsten rat sarcoma.

# Who many procedure for Training and Competency?

---

- ❖ The European Respiratory Society/American Thoracic Society statement on interventional pulmonology recommends completion of 40 supervised procedures for achievement of initial competency in EBUS.

# Cryobiopsy

## קריוביופסיה מול ביופסיה רגילה

**Figure 2** Histological sample of (a) forceps-transbronchial biopsies (TBB) ( $\times 4$  magnification) showing mainly peribronchial alveolar tissue with interstitial infiltration but no signs of rejection versus (b) cryo-TBB ( $\times 4$  magnification) composed of alveolar tissue with abundant alveoli and blood vessels with peri-vascular infiltration by lymphocytes indicating acute cellular rejection A1.

## Meir MC experience: 2018

---

- ❖ 587 EBUS procedures.
- ❖ 37% from all bronchoscopies.
- ❖ 85% of all EBUS performed under moderate sedation.
- ❖ 40% of the EBUS for diagnosis and staging of lung cancer.
- ❖ 40% only for staging of lung cancer.
- ❖ 15% for obtaining more specimen for molecular testing.
- ❖ 5% for other indications including lung metastasis LN.

Thank you!
