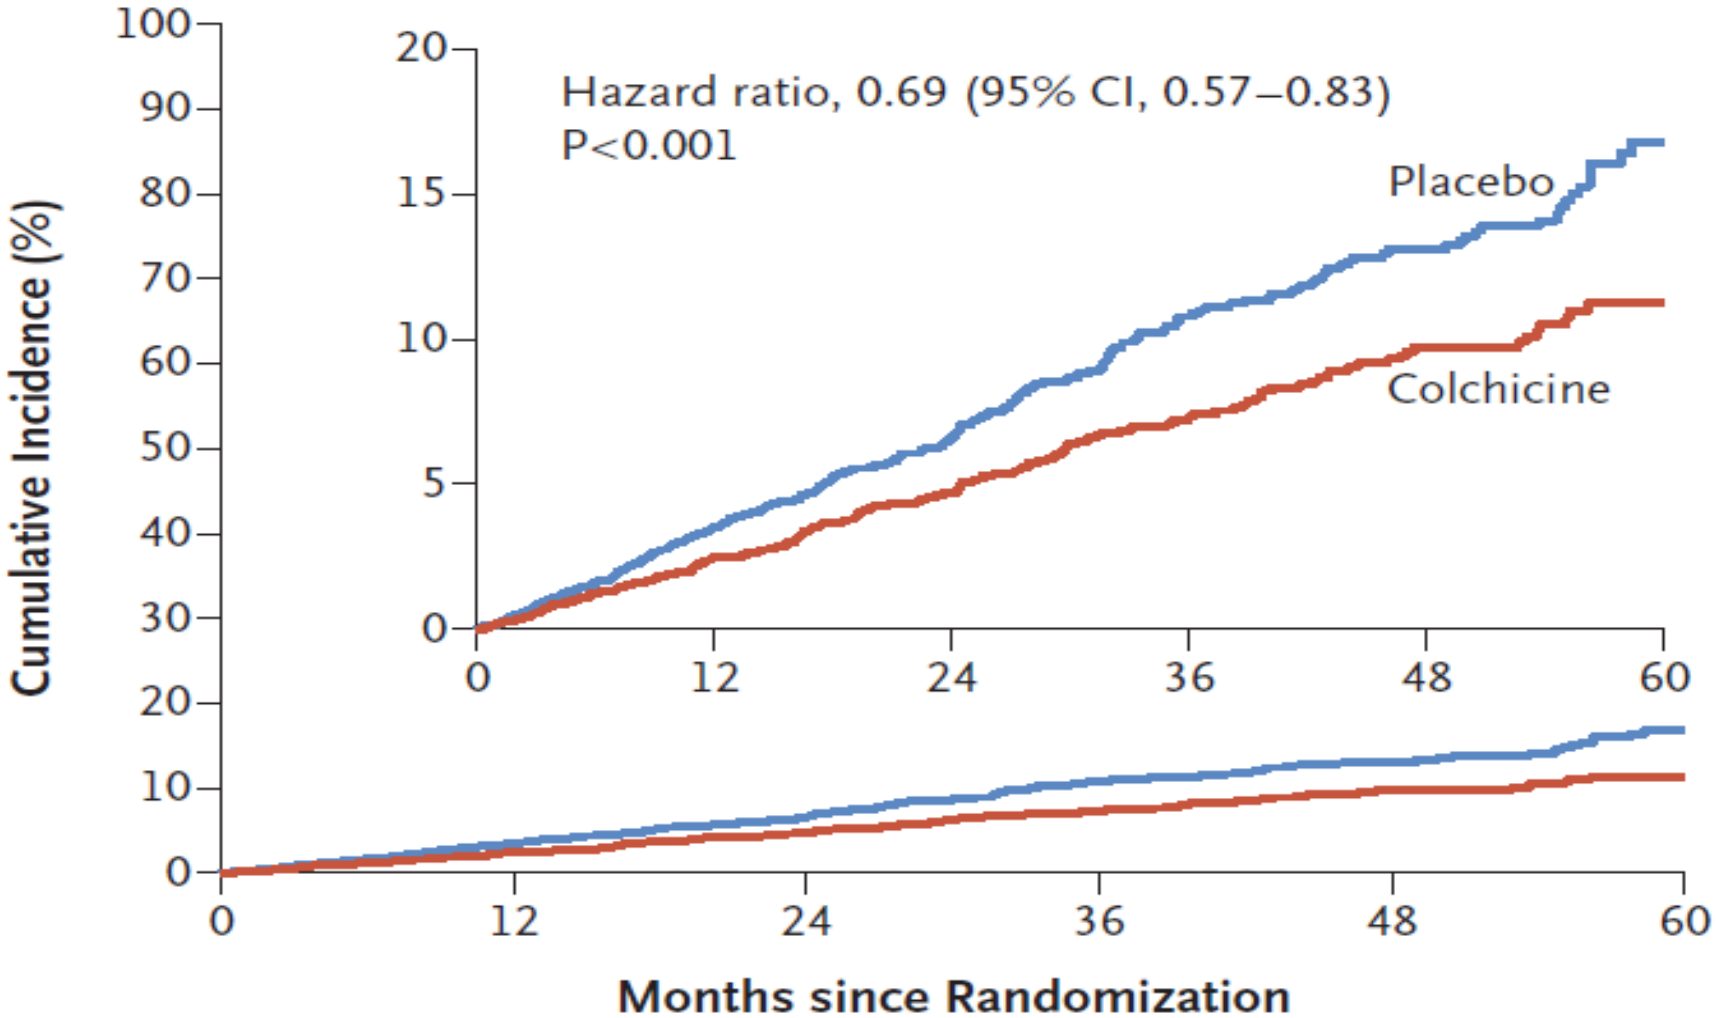
Colchicine in Patients with Chronic Coronary Disease

LoDoCo2 Australian New Zealand Clinical Trials

The NEW ENGLAND JOURNAL of MEDICINE

Characteristic	Colchicine (N = 2762)	Placebo (N = 2760)
Age — yr	65.8±8.4	65.9±8.7
Female sex — no. (%)	457 (16.5)	389 (14.1)
Country — no. (%)		
Australia	951 (34.4)	953 (34.5)
The Netherlands	1811 (65.6)	1807 (65.5)
Current smoker — no. (%)†	318 (11.5)	330 (12.0)
Hypertension — no. (%)	1421 (51.4)	1387 (50.3)
Diabetes — no. (%)		
Patients receiving any treatment for diabetes	492 (17.8)	515 (18.7)
Patients dependent on insulin	140 (5.1)	147 (5.3)
Renal function — no. (%)‡		
Stage 1 or 2	2614 (94.6)	2602 (94.3)
Stage 3a	148 (5.4)	158 (5.7)
Prior acute coronary syndrome — no. (%)	2323 (84.1)	2335 (84.6)
Time since last acute coronary syndrome — no. (%)		
≤24 mo	753 (27.3)	726 (26.3)
>24 mo	1570 (56.8)	1609 (58.3)
Prior coronary revascularization — no. (%)	2301 (83.3)	2320 (84.1)
Coronary-artery bypass grafting	319 (11.5)	391 (14.2)
Percutaneous coronary intervention	2100 (76.0)	2077 (75.3)
History of atrial fibrillation — no. (%)	332 (12.0)	317 (11.5)
History of gout — no. (%)	220 (8.0)	226 (8.2)
Medication use — no. (%)		
Single antiplatelet therapy	1849 (66.9)	1852 (67.1)
Dual antiplatelet therapy	638 (23.1)	642 (23.3)
Anticoagulant	342 (12.4)	330 (12.0)
No antiplatelet agent or anticoagulant	4 (0.1)	11 (0.4)
Statin	2594 (93.9)	2594 (94.0)
Ezetimibe	551 (19.9)	522 (18.9)
Any lipid-lowering agent	2670 (96.7)	2665 (96.6)
Renin–angiotensin inhibitor	1995 (72.2)	1965 (71.2)
Beta-blocker	1692 (61.3)	1735 (62.9)
Calcium-channel blocker	633 (22.9)	611 (22.1)

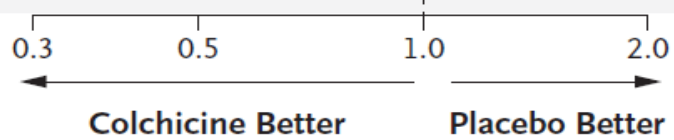
A Primary End Point



No. at Risk

Placebo	2760	2655	1703	821	590	161
Colchicine	2762	2685	1761	890	629	166

End Point	Colchicine (N=2762)		Placebo (N=2760)		Hazard Ratio (95% CI)	P Value
	no. of patients (%)	*no. of events/100 person-yr*	*no. of patients (%)*	*no. of events/100 person-yr*		
Primary end point						
Cardiovascular death, myocardial infarction, ischemic stroke, or ischemia-driven coronary revascularization	187 (6.8)	2.5	264 (9.6)	3.6	0.69 (0.57–0.83)	<0.001
Secondary end points in ranked order						
Cardiovascular death, myocardial infarction, or ischemic stroke	115 (4.2)	1.5	157 (5.7)	2.1	0.72 (0.57–0.92)	0.007
Myocardial infarction or ischemia-driven coronary revascularization	155 (5.6)	2.1	224 (8.1)	3.0	0.67 (0.55–0.83)	<0.001
Cardiovascular death or myocardial infarction	100 (3.6)	1.3	138 (5.0)	1.8	0.71 (0.55–0.92)	0.01
Ischemia-driven coronary revascularization	135 (4.9)	1.8	177 (6.4)	2.4	0.75 (0.60–0.94)	0.01
Myocardial infarction	83 (3.0)	1.1	116 (4.2)	1.5	0.70 (0.53–0.93)	0.01
Ischemic stroke	16 (0.6)	0.2	24 (0.9)	0.3	0.66 (0.35–1.25)	0.20
Death from any cause	73 (2.6)	0.9	60 (2.2)	0.8	1.21 (0.86–1.71)	
Cardiovascular death	20 (0.7)	0.3	25 (0.9)	0.3	0.80 (0.44–1.44)	
Additional end points						
The primary end point in the first LoDoCo trial	201 (7.3)	2.7	290 (10.5)	4.0	0.67 (0.56–0.81)	
New onset or first recurrence in atrial fibrillation or atrial flutter	126 (4.6)	1.7	148 (5.4)	2.0	0.84 (0.66–1.07)	
Deep-vein thrombosis or pulmonary embolism or both	17 (0.6)	0.2	16 (0.6)	0.2	1.06 (0.53–2.10)	
Any myocardial infarctions	85 (3.1)	1.1	117 (4.2)	1.5	0.72 (0.54–0.95)	
New-onset diabetes	34 (1.2)	—	49 (1.8)	—	0.69 (0.44–1.06)	



In a randomized trial involving patients with chronic coronary disease, the risk of cardiovascular events was significantly lower among those who received **0.5 mg of colchicine once daily** than among those who received placebo.

Improving population level LDL-C goal attainment through a personalized approach to intensive LDL-C lowering.

2020 ESC Guidelines

ESC European Society of Cardiology

European Heart Journal (2020) **00**, 1–125
doi:10.1093/eurheartj/ehaa612

ESC GUIDELINES

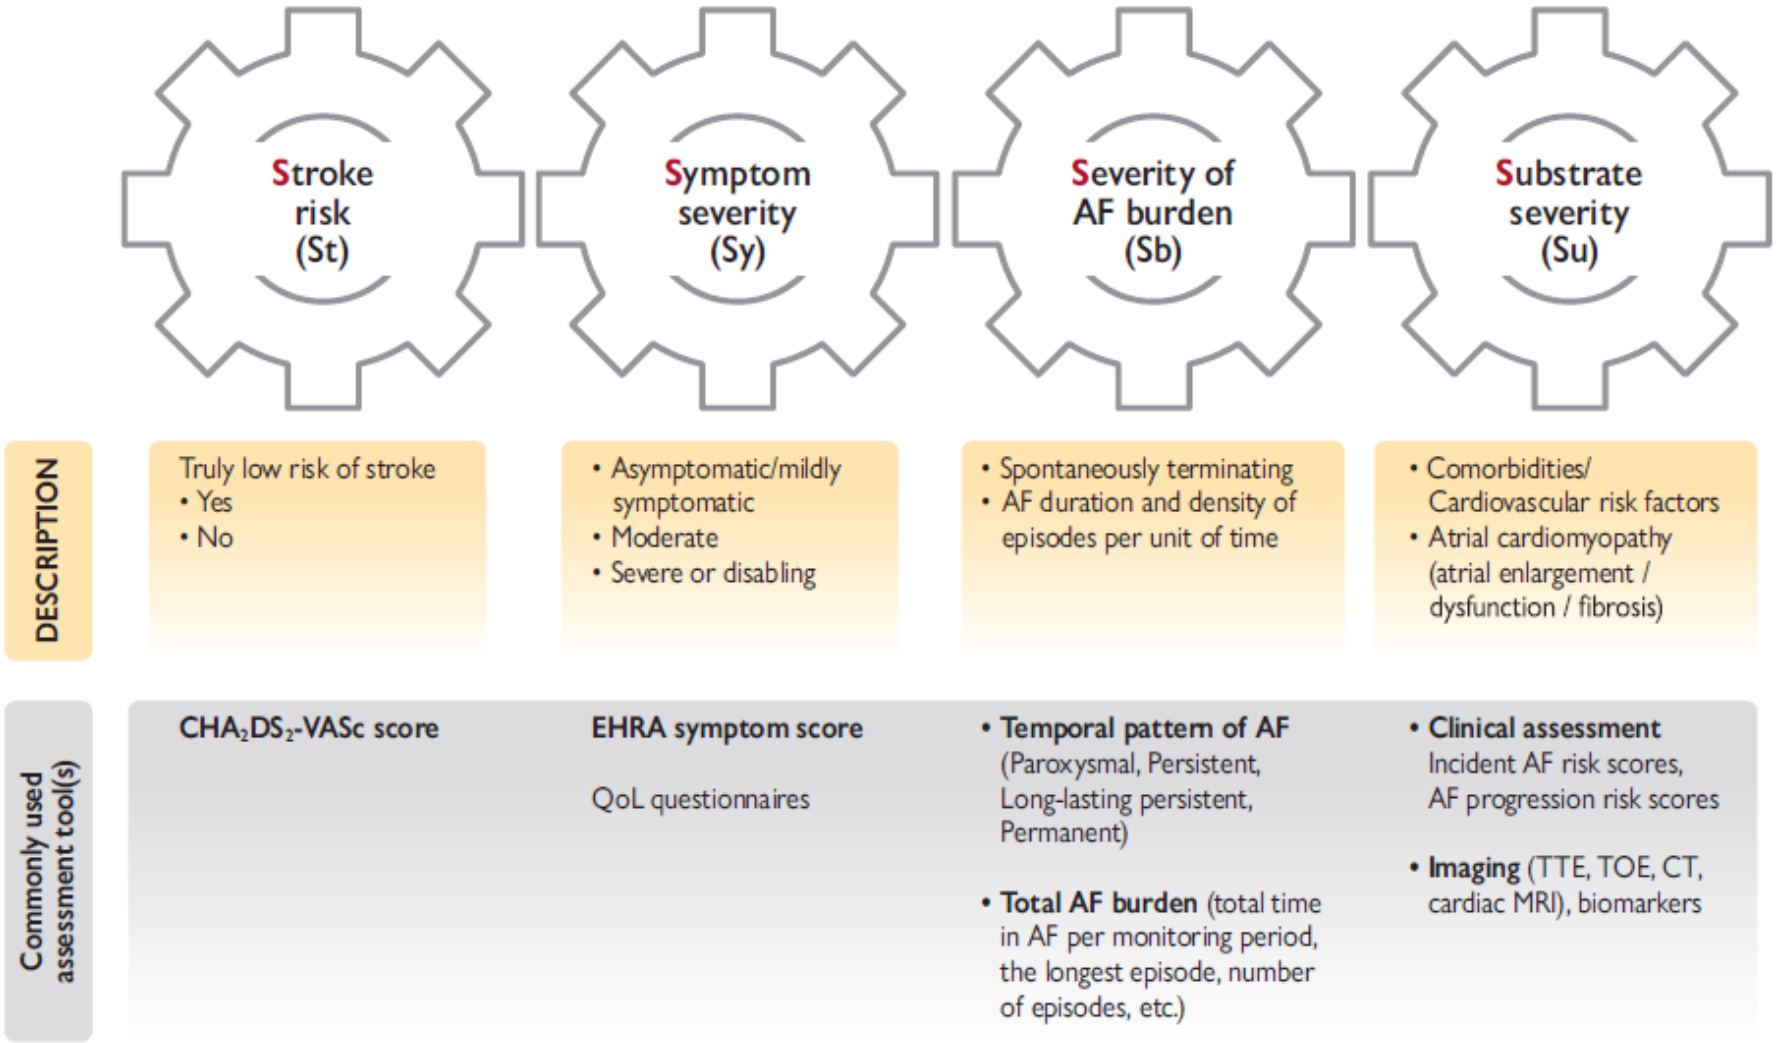
2020 ESC Guidelines for the diagnosis and management of atrial fibrillation developed in collaboration with the European Association of Cardio-Thoracic Surgery (EACTS)

The Task Force for the diagnosis and management of atrial fibrillation of the European Society of Cardiology (ESC)

Developed with the special contribution of the European Heart Rhythm Association (EHRA) of the ESC

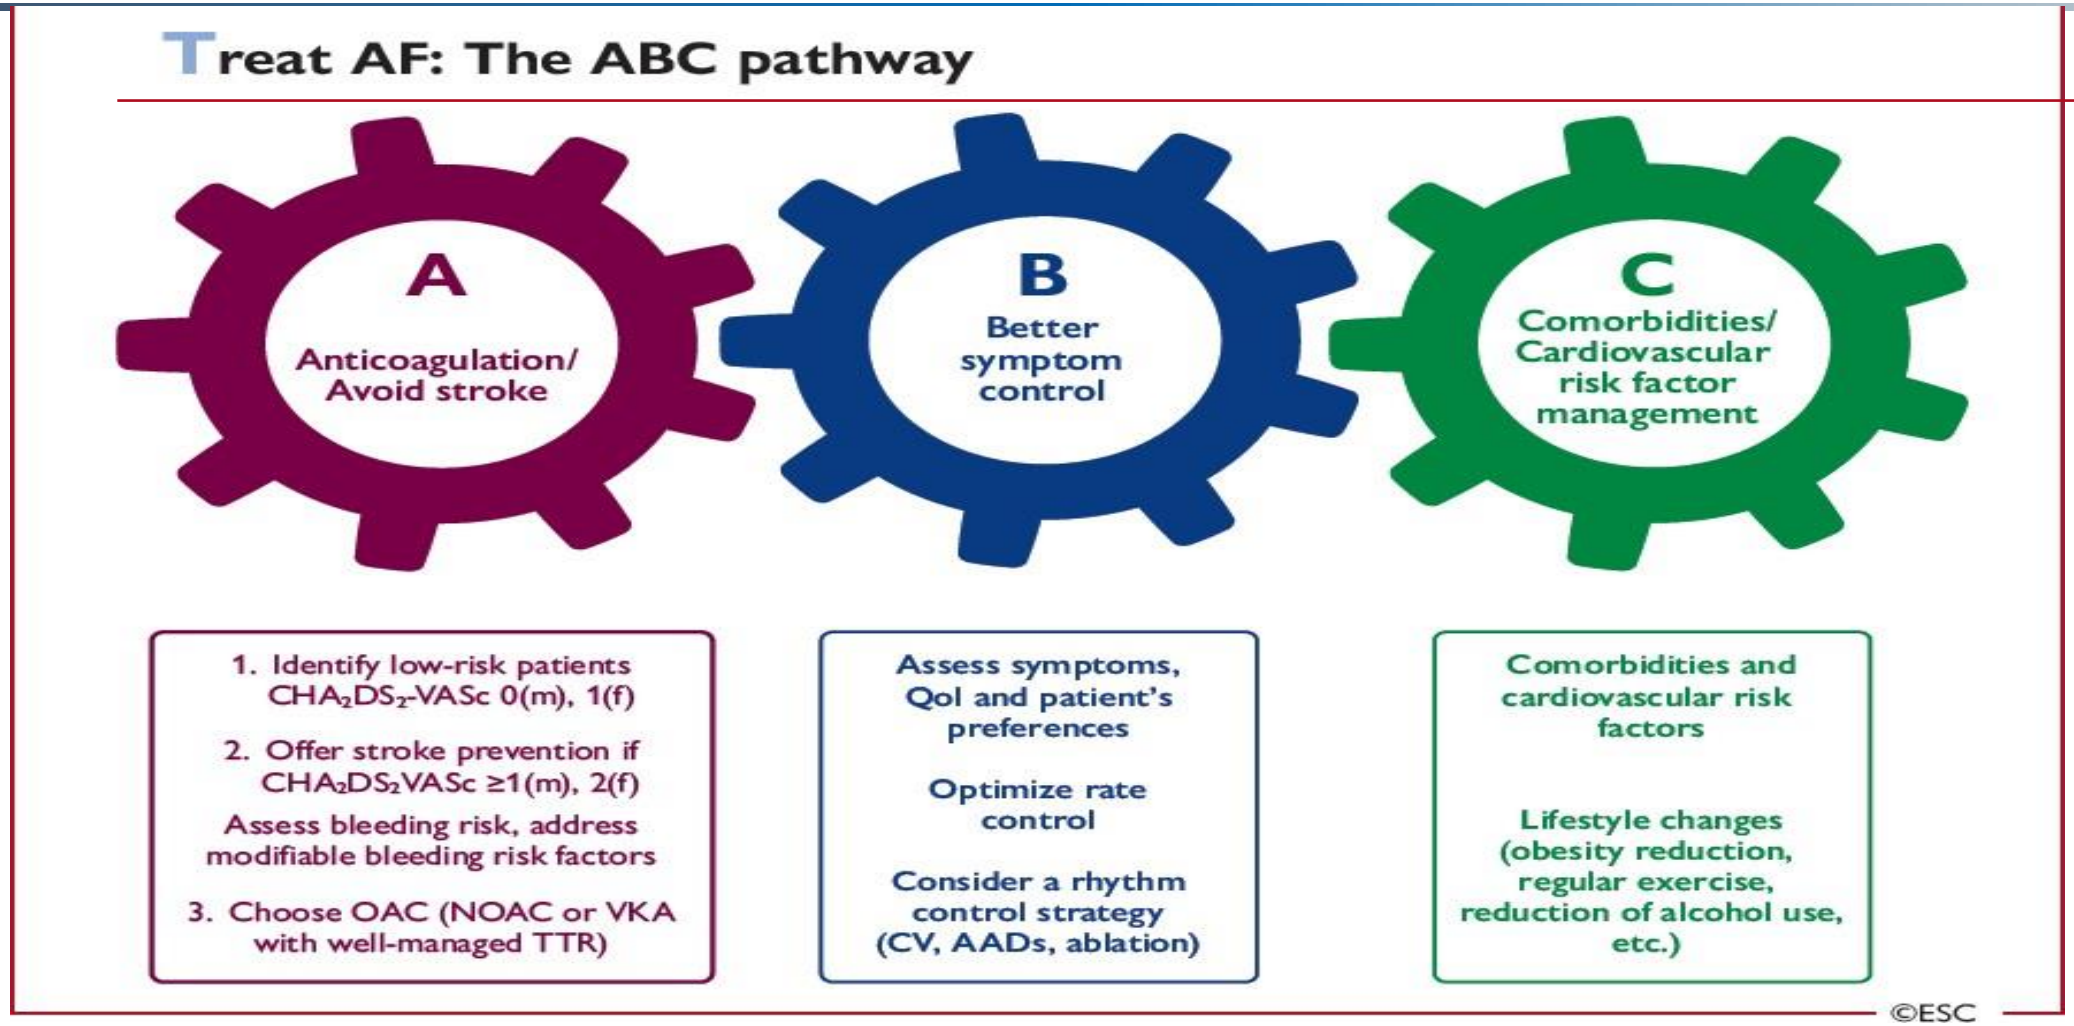
Authors/Task Force Members: Gerhard Hindricks* (Chairperson) (Germany), Tatjana Potpara* (Chairperson) (Serbia), Nikolaos Dagres (Germany), Elena Arbelo (Spain), Jeroen J. Bax (Netherlands), Carina Blomström-Lundqvist (Sweden), Giuseppe Boriani (Italy), Manuel Castella[1] (Spain), Gheorghe-Andrei Dan (Romania), Polychronis E. Dilaveris (Greece), Laurent Fauchier (France), Gerasimos Filippatos (Greece), Jonathan M. Kalman (Australia), Mark La Meir[1]

4S-AF scheme as an example of structured characterization of AF



Gerhard Hindricks, Tatjana Potpara, Gregory Y H Lip et al, 2020 ESC Guidelines for the diagnosis and management of atrial fibrillation developed in collaboration with the European Association of Cardio-Thoracic Surgery (EACTS): The Task Force for the diagnosis and management of atrial fibrillation of the European Society of Cardiology (ESC) Developed with the special contribution of the European Heart Rhythm Association (EHRA) of the ESC, European Heart Journal, , ehaa612, https://doi.org/10.1093/eurheartj/ehaa612

Management of AF (2)



Gerhard Hindricks, Tatjana Potpara, Gregory Y H Lip et al, 2020 ESC Guidelines for the diagnosis and management of atrial fibrillation developed in collaboration with the European Association of Cardio-Thoracic Surgery (EACTS): The Task Force for the diagnosis and management of atrial fibrillation of the European Society of Cardiology (ESC) Developed with the special contribution of the European Heart Rhythm Association (EHRA) of the ESC, European Heart Journal, , ehaa612, https://doi.org/10.1093/eurheartj/ehaa612

Recommendations for the prevention of thromboembolic events in AF

Recommendations	Class	Level
For stroke prevention in AF patients who are eligible for OAC, NOACs are recommended in preference to VKAs (excluding patients with mechanical heart valves or moderate-to-severe mitral stenosis).	I	A
For stroke risk assessment, a risk-factor–based approach is recommended, using the CHA_2DS_2-VASc clinical stroke risk score to initially identify patients at 'low stroke risk' (CHA_2DS_2-VASc score = 0 in men, or 1 in women) who should not be offered antithrombotic therapy.	I	A
OAC is recommended for stroke prevention in AF patients with CHA_2DS_2-VASc score ≥2 in men or ≥3 in women.	I	A

Gerhard Hindricks, Tatjana Potpara, Gregory Y H Lip et al, 2020 ESC Guidelines for the diagnosis and management of atrial fibrillation developed in collaboration with the European Association of Cardio-Thoracic Surgery (EACTS): The Task Force for the diagnosis and management of atrial fibrillation of the European Society of Cardiology (ESC) Developed with the special contribution of the European Heart Rhythm Association (EHRA) of the ESC, European Heart Journal, , ehaa612, https://doi.org/10.1093/eurheartj/ehaa612

Better Symptom Control

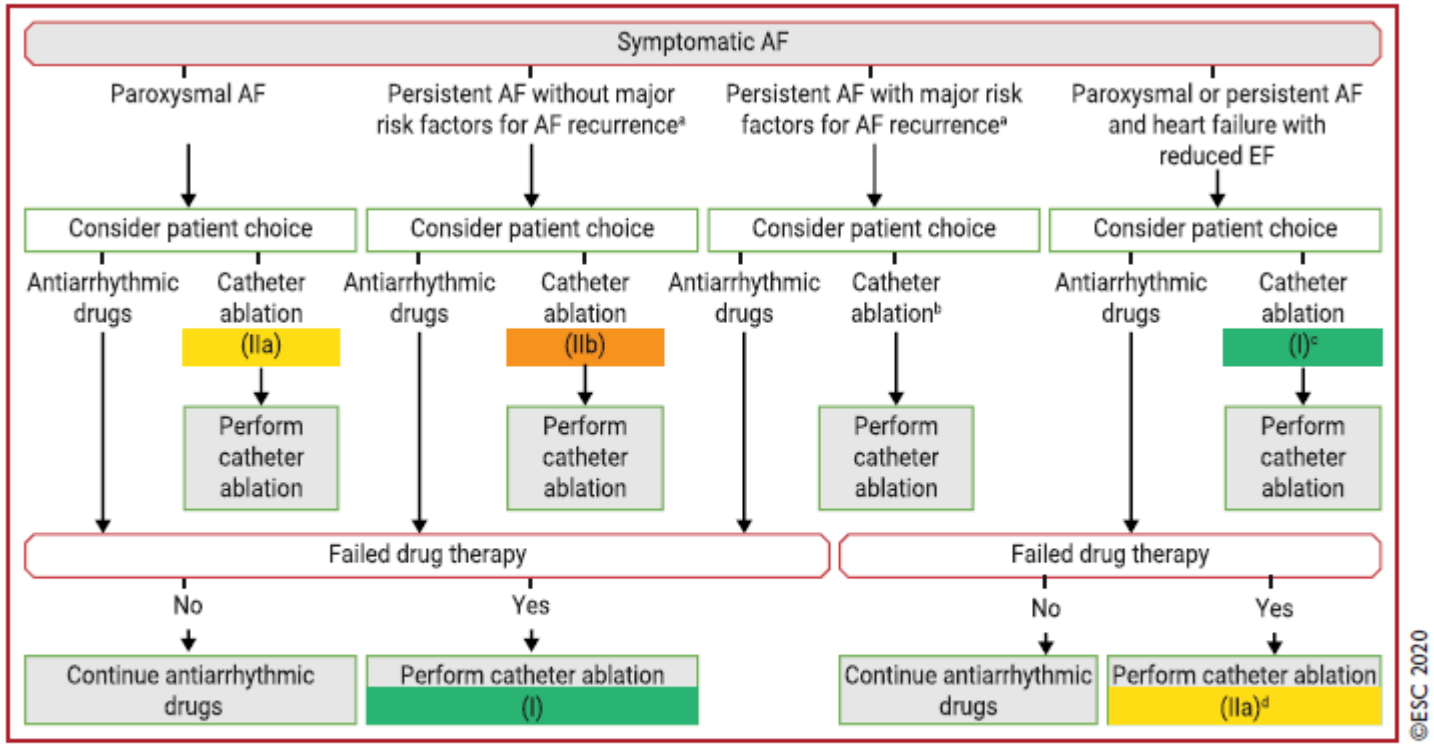


Figure 17 Indications for catheter ablation of symptomatic AF. The arrows from AAD to ablation indicate failed drug therapy. AAD = antiarrhythmic drug; AF = atrial fibrillation; EF = ejection fraction; LA = left atrial. [a]Significantly enlarged LA volume, advanced age, long AF duration, renal dysfunction, and other cardiovascular risk factors. [b]In rare individual circumstances, catheter ablation may be carefully considered as first-line therapy. [c]Recommended to reverse LV dysfunction when tachycardiomyopathy is highly probably. [d]To improve survival and reduce hospitalization.

Figure 18 Risk factors for AF contributing to the development of an abnormal substrate translating into poorer outcomes with rhythm control strategies. AF = atrial fibrillation; BMI = body mass index; CPAP = continuous positive airway pressure; HbA_{1C} = haemoglobin A1c; OSA = obstructive sleep apnoea. Several AF risk factors may contribute to the development of LA substrates and thus affect the outcome of AF catheter ablation, predisposing to a higher recurrence rate. Aggressive control of modifiable risk factors may reduce recurrence rate.

Gerhard Hindricks, Tatjana Potpara, Gregory Y H Lip et al, 2020 ESC Guidelines for the diagnosis and management of atrial fibrillation developed in collaboration with the European Association of Cardio-Thoracic Surgery (EACTS): The Task Force for the diagnosis and management of atrial fibrillation of the European Society of Cardiology (ESC) Developed with the special contribution of the European Heart Rhythm Association (EHRA) of the ESC, European Heart Journal, , ehaa612, https://doi.org/10.1093/eurheartj/ehaa612

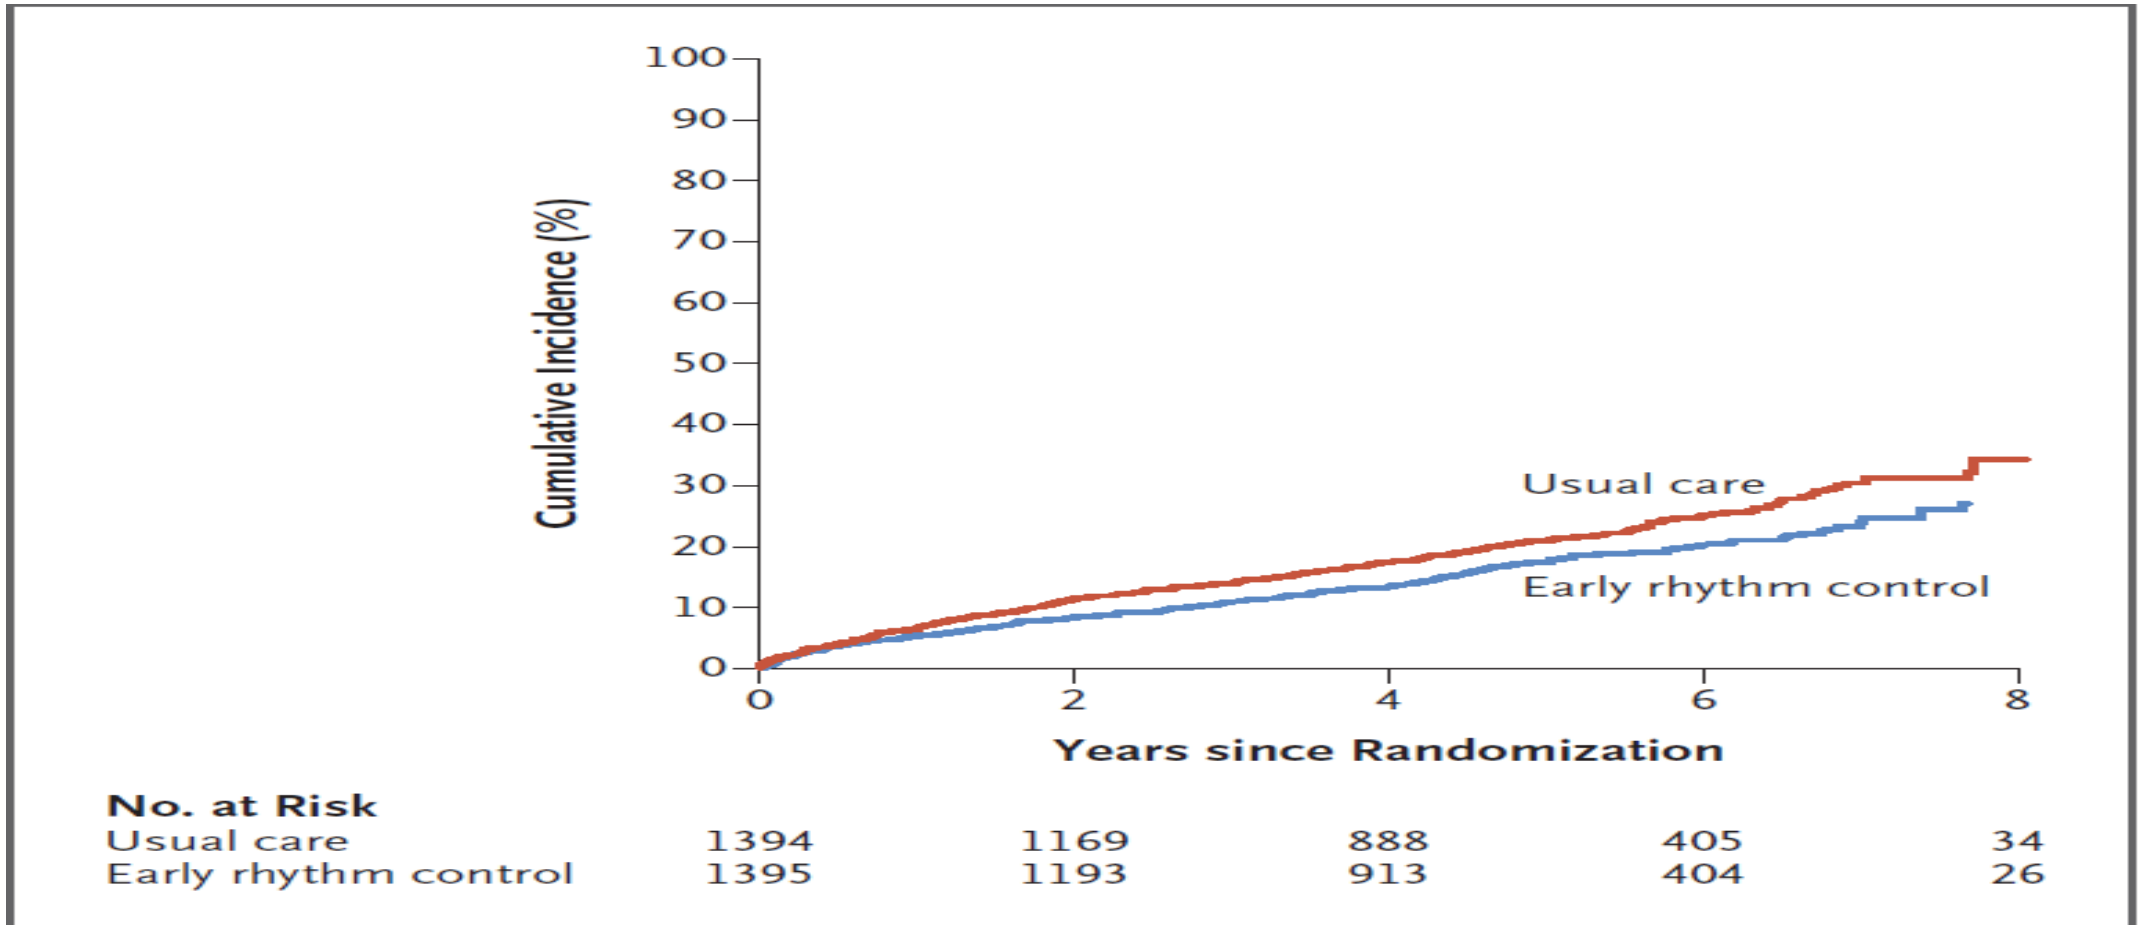
Outcomes

Table 2. Efficacy Outcomes.*

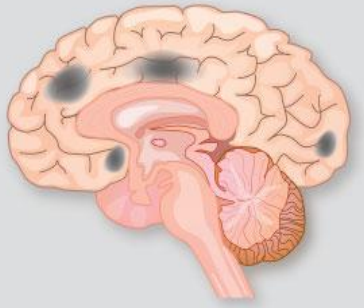
Outcome	Early Rhythm Control	Usual Care	Treatment Effect
First primary outcome — events/person-yr (incidence/100 person-yr)	249/6399 (3.9)	316/6332 (5.0)	0.79 (0.66 to 0.94)†
Components of first primary outcome — events/person-yr (incidence/100 person-yr)			
Death from cardiovascular causes	67/6915 (1.0)	94/6988 (1.3)	0.72 (0.52 to 0.98)‡
Stroke	40/6813 (0.6)	62/6856 (0.9)	0.65 (0.44 to 0.97)‡
Hospitalization with worsening of heart failure	139/6620 (2.1)	169/6558 (2.6)	0.81 (0.65 to 1.02)‡
Hospitalization with acute coronary syndrome	53/6762 (0.8)	65/6816 (1.0)	0.83 (0.58 to 1.19)‡
Second primary outcome — nights spent in hospital/yr	5.8±21.9	5.1±15.5	1.08 (0.92 to 1.28)§
Key secondary outcomes at 2 yr			
Change in left ventricular ejection fraction — %	1.5±9.8	0.8±9.8	0.23 (–0.46 to –0.91)¶
Change in EQ-5D score‖	–1.0±21.4	–2.7±22.3	1.07 (–0.68 to 2.82)¶
Change in SF-12 Mental Score**	0.7±10.6	1.6±10.1	–1.20 (–2.04 to –0.37)¶
Change in SF-12 Physical Score**	0.3±8.5	0.1±8.2	0.33 (–0.39 to 1.06)¶
Change in MoCA score	0.1±3.3	0.1±3.2	–0.14 (–0.39 to 0.12)¶
Sinus rhythm — no. of patients with feature/total no. (%)	921/1122 (82.1)	687/1135 (60.5)	3.13 (2.55 to 3.84)††
Asymptomatic — no. of patients with feature/total no. (%)‡‡	861/1159 (74.3)	850/1171 (72.6)	1.14 (0.93 to 1.40)††

Conclusions- Early rhythm-control therapy was associated with a lower risk of cardiovascular outcomes than usual care among patients with early atrial fibrillation and cardiovascular conditions



Brain Damage and Change in Cognitive Function in Patients with Atrial Fibrillation

BASELINE

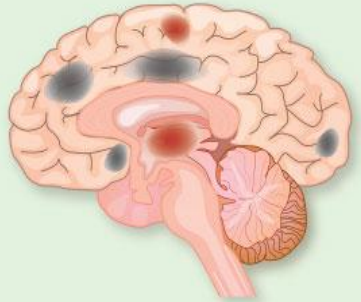


Patients with atrial fibrillation:

- n=1227
- Mean age : 71 years
- OAC: 90%
- History of stroke /TIA: 19%

Standardized brain MRI
&
Cognitive testing

2 YEAR FOLLOW-UP



New brain lesions:

- 2.3% new clinical stroke /TIA
- 5.5% new brain infarcts on MRI (88 % on OAC, 85 % silent)

Cognitive decline in patients with new overt or silent brain infarcts

Silent brain infarcts impact on cognitive function in atrial fibrillation

Incidence of Stroke is Directly Dependent on Diagnostic Methods Used and Traditional Stroke Symptoms Correlate Inconsistently with Infarcts on MRI

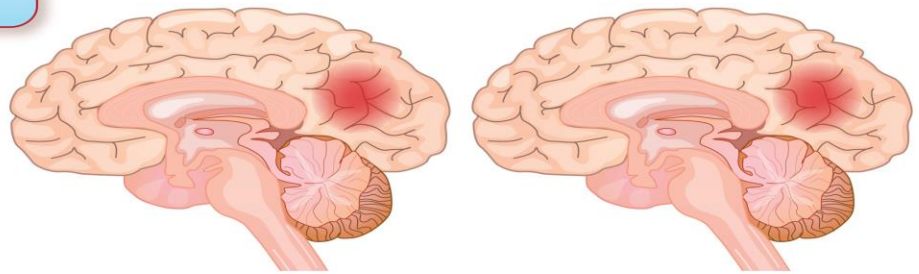
Different Viewpoints/Perspectives

Clinical Stroke/TIA Symptoms at 2 years → 2.3% Incidence

Brain MRI at 2 Years → 5.5% Incidence

2.4x Increase

Are "Silent" Strokes Really Silent?



Traditional Clinical Symptoms

No Traditional Clinical Symptoms

Deficiencies of cognitive operations, semantic memory, language production and mental flexibility are present with testing at 2 years

Brain Injury in Patients with Atrial Fibrillation

1. "Clinical" Stroke/TIA diagnosis significantly underestimated incidence
2. "Silent" Strokes is a misnomer and these infarcts impact function when targeted testing is used

Eur Heart J, ehab900, https://doi.org/10.1093/eurheartj/ehab900

Predictor	Estimate (95% CI)	p-value

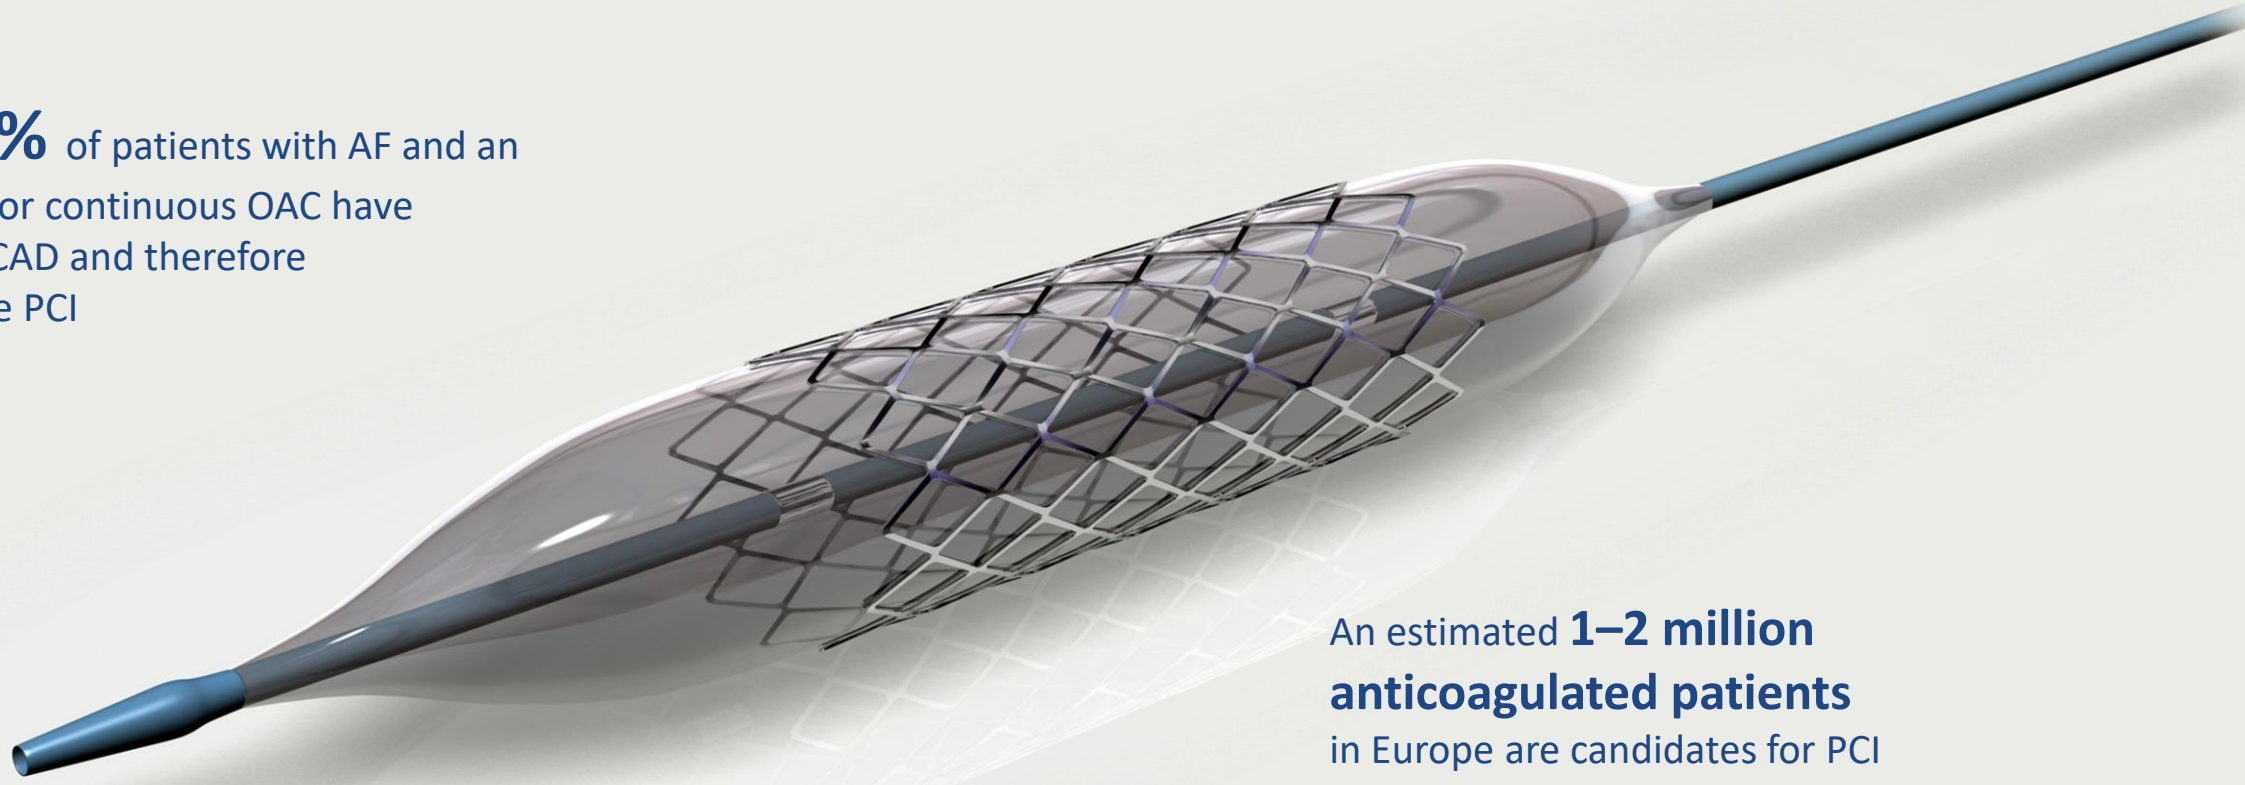
There is an unmet need in the management of patients with AF undergoing PCI

20–30% of patients with AF and an indication for continuous OAC have coexisting CAD and therefore may require PCI



An estimated **1–2 million anticoagulated patients** in Europe are candidates for PCI procedures

Stenting requires follow-up treatment with antiplatelets, which puts anticoagulated patients at **higher risk of bleeding**

CAD, coronary artery disease; PCI, percutaneous coronary intervention; Lip et al. Thromb Haemost 2010

High risk of bleeding or overt bleeding on DAPT
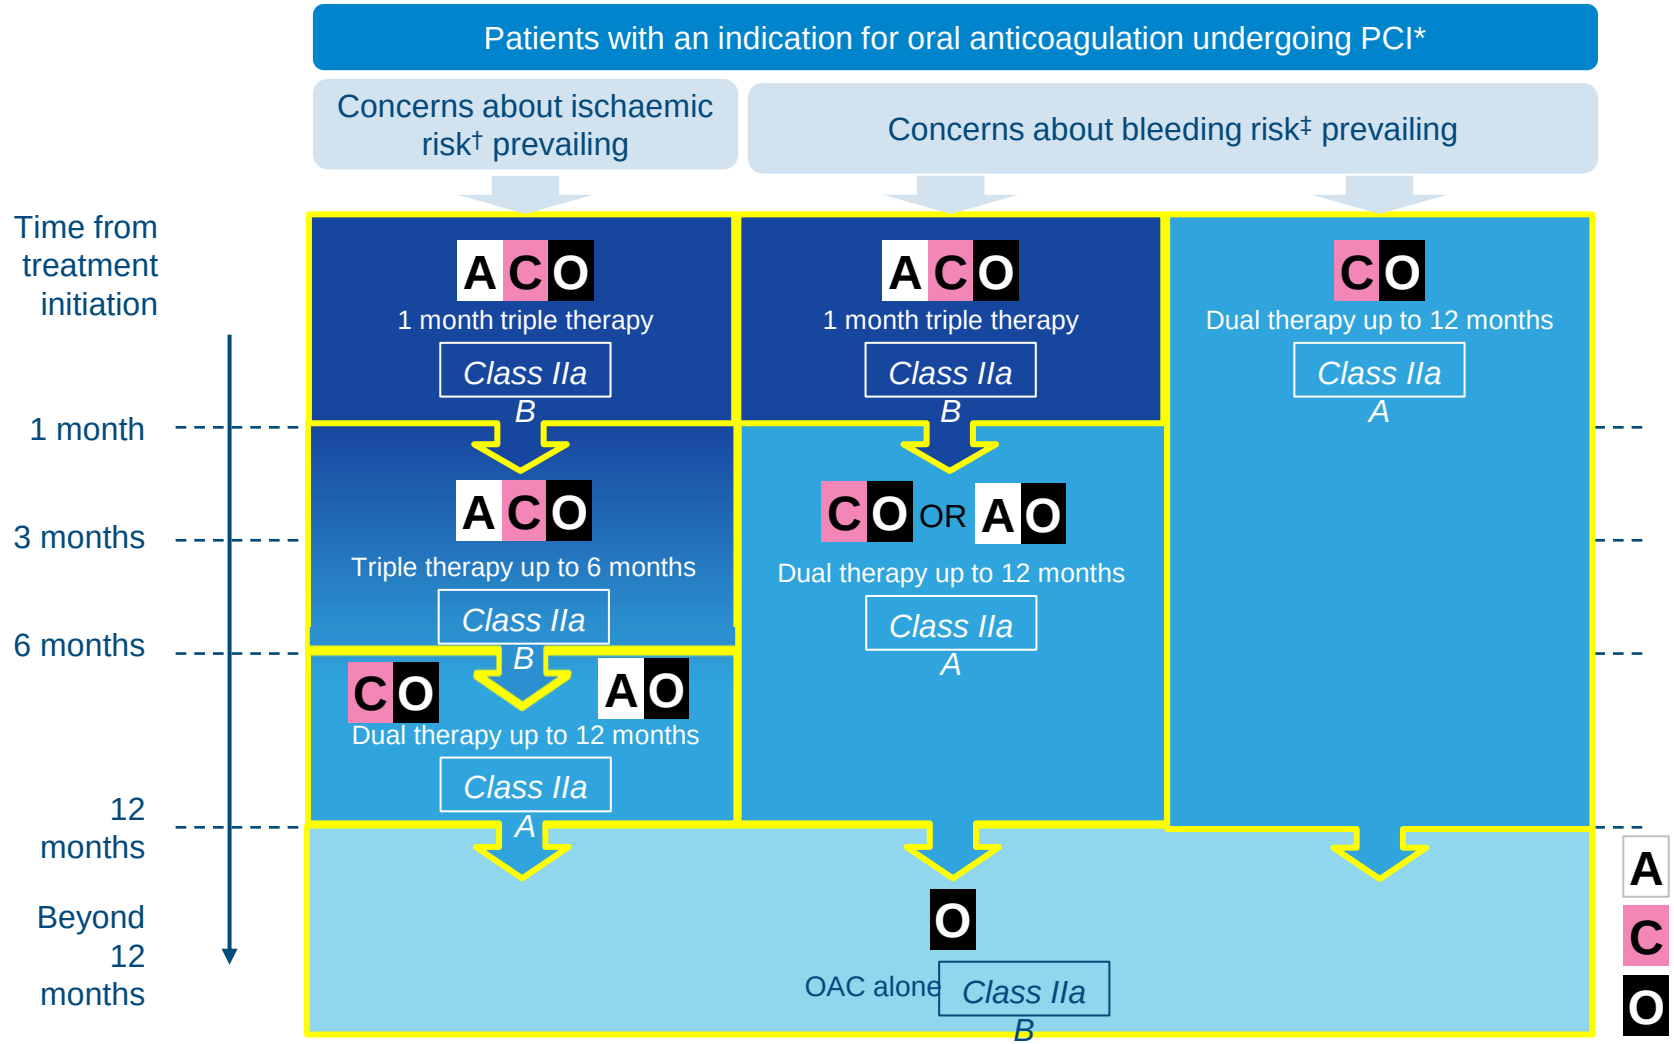
Discontinuation of P2Y12 after 6 mo may be reasonable (2b)
>6 mo of DAPT may be reasonable (2b)
>I mo of DAPT may be reasonable (2b)
No high risk of bleeding and no significant overt bleeding on DAPT
>I y of DAPT may be reasonable (2b)

ESC focused update recommends dual or triple therapy after PCI with stent depending on individual patient risk factors



1. Peri-procedural administration of aspirin and clopidogrel during PCI is recommended irrespective of the treatment strategy; 2. High ischemic risk is considered as an acute clinical presentation or anatomical/procedural features which might increase the risk for myocardial infarction; 3. Bleeding risk can be estimated by HAS-BLED or ABC score. Valgimigli et al. Eur J Cardio-Thoracic Surgery 2017

Mavacamten for treatment of symptomatic obstructive hypertrophic cardiomyopathy (EXPLORER-HCM)

- Mavacamten is a first-in-class, small molecule, selective allosteric inhibitor of cardiac myosin ATPase specifically developed to target the underlying pathophysiology of hypertrophic cardiomyopathy by reducing actin–myosin cross-bridge formation, thereby reducing contractility and improving myocardial energetics.

- Grillo MP, Erve JCL, Dick R, et al. In vitro and in vivo pharmacokinetic characterization of mavacamten, a first-in-class small molecule allosteric modulator of beta cardiac myosin. *Xenobiotica* 2019; **49:** 718–33.
- Kawas RF, Anderson RL, Ingle SRB, Song Y, Sran AS, Rodriguez HM. A small-molecule modulator of cardiac myosin acts on multiple stages of the myosin chemomechanical cycle. *J Biol Chem* 2017; **292:** 16571–77.

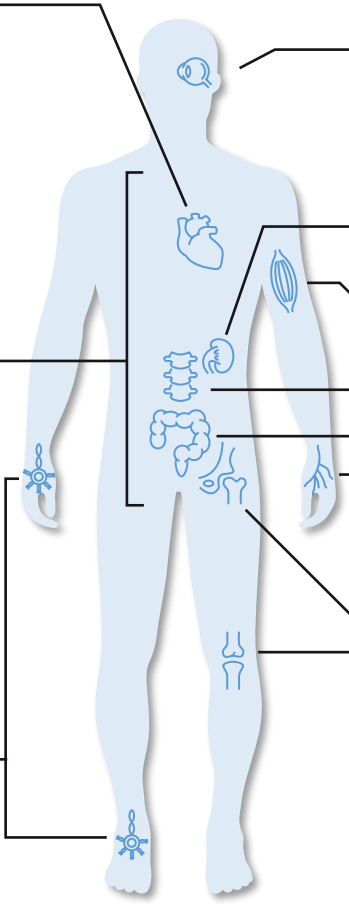
Conclusions

In conclusion, in this first positive randomised phase 3 trial in patients with obstructive hypertrophic cardiomyopathy, mavacamten treatment improved functional capacity, LVOT gradient, symptoms, and key aspects of health status. The results of this pivotal trial highlight the benefits of disease-specific treatment in hypertrophic cardiomyopathy.

ATTR-CM Can Manifest in a Wide Range of Signs and Symptoms, Both Cardiac and Extracardiac[1-14]



CARDIOVASCULAR

- Heart failure (HF), especially with preserved ejection fraction
- Preponderance of right heart failure signs
- Echo showing increased left ventricular (LV) wall thickness
- Low QRS voltage relative to LV thickness
- Atrioventricular block with increased LV thickness
- Conduction abnormalities and arrhythmia, especially atrial fibrillation
- Intolerance to standard HF therapies
- Hypertrophic cardiomyopathy with infiltrative signs on magnetic resonance, such as apical sparing of longitudinal strain
- Aortic stenosis
- Mild increase in cardiac biomarkers

NERVOUS SYSTEM

AUTONOMIC

- Unexplained weight loss
- Orthostatic hypotension
- Sexual impotence
- Urinary retention and/or incontinence

PERIPHERAL

- Peripheral sensory motor dysfunction
- Muscle atrophy

OCULAR

- Vitreous opacity
- Glaucoma

RENAL

- Proteinuria
- Renal impairment
- Cardiorenal syndrome

MUSCULOSKELETAL/ORTHOPEDIC

- Biceps tendon rupture
- Lumbar spinal stenosis
- Carpal tunnel syndrome
- Hip/knee arthroplasty

GASTROINTESTINAL TRACT

- Diarrhea and/or constipation
- Fecal incontinence
- Nausea and vomiting, and early satiety, leading to weight loss

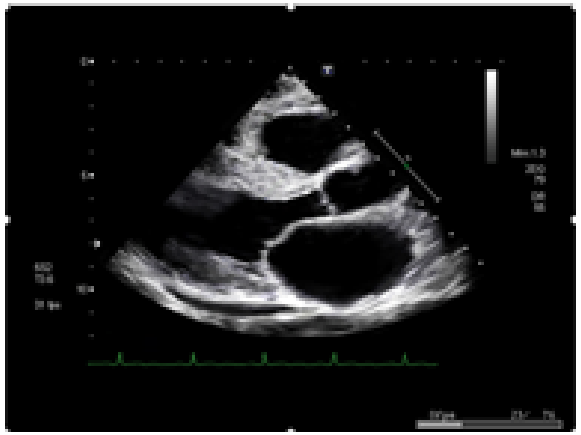
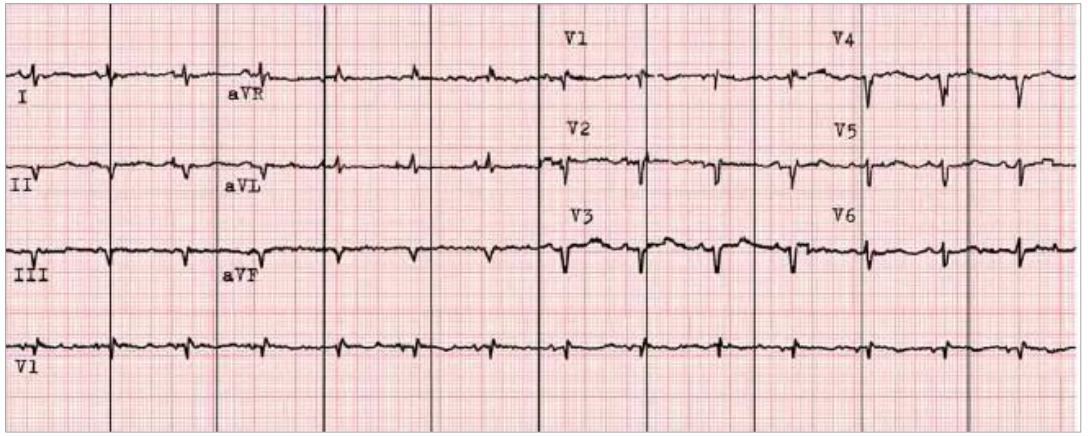
Cardiac Clinical Clues

Electrocardiography

- Discordance between left ventricular wall thickness and QRS voltage[1]
- Pseudoinfarct pattern in up to 70% of cases[2]
- Arrhythmia and/or conduction disease[2,3]





Illustrative representations

Absence of low voltage does not rule out ATTR-CM as prevalence varies among ATTR-CM types.[4-8]

Nuclear Scintigraphy Is a Noninvasive, Widely Available Diagnostic Tool for ATTR-CM

Nuclear scintigraphy with ^{99m}Tc-labelled radiotracers is highly sensitive and specific to diagnose ATTR-CM when combined with testing for presence of monoclonal protein to rule out AL amyloidosis[1,2]

Three ^{99m}Tc-based bone radiotracers extensively studied for detecting amyloid deposition in the myocardium[3]

- **^{99m}Tc-PYP**
  pyrophosphate
- **^{99m}Tc-DPD**
  3,3-diphosphono-1,2-propanodicarboxylic acid
- **^{99m}Tc-HMDP**
  hydroxymethylene diphosphonate

Uptake of ^{99m}Tc-DPD in the Whole Body

Illustrative representation of ^{99m}Tc-DPD uptake developed in collaboration with Torbjörn Sundström, MD, PhD, Radiology/Nuclear Medicine, Umeå University Hospital, Sweden.

Criteria for Diagnosing ATTR-CM[4]

- ^{99m}Tc-PYP, DPD, HMDP myocardial uptake ≥ Grade 2
- AL amyloidosis ruled out
- Typical cardiac imaging features (echocardiography, CMR, PET)

LEARN MORE ABOUT INTERPRETATION OF ^{99M}TC-PYP/DPD/HMDP PLANAR AND SPECT UPTAKE

SPECT imaging is necessary in all cases of positive planar uptake to differentiate myocardial enhancement from blood pool[4]

To facilitate early diagnosis, scintigraphy should be more broadly considered in patients with the following[4]:

- Unexplained LV wall thickness
- HFpEF
- Familial history of amyloidosis
- Degenerative AS with low-flow gradient in elderly
- History of bilateral carpal tunnel syndrome

AL=immunoglobulin light chain amyloidosis; AS=aortic stenosis; CMR=cardiac magnetic resonance; HFpEF=heart failure with preserved ejection fraction; PET=positron emission tomography; Tc=technetium-labelled; LV=left ventricular.

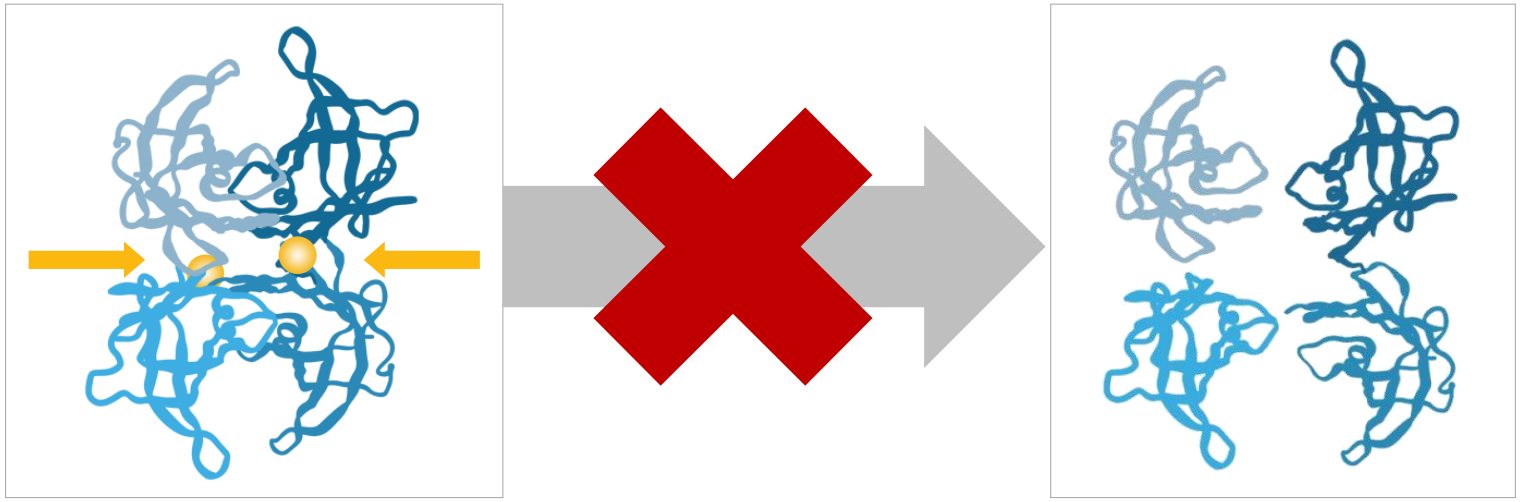
MECHANISM of ACTION

VYNDAMAX (tafamidis) Is a Selective Stabilizer of TTR[1,2]



Tafamidis stabilizes TTR to prevent dissociation into monomers, the rate-limiting step in the amyloidogenic process.[1,2]

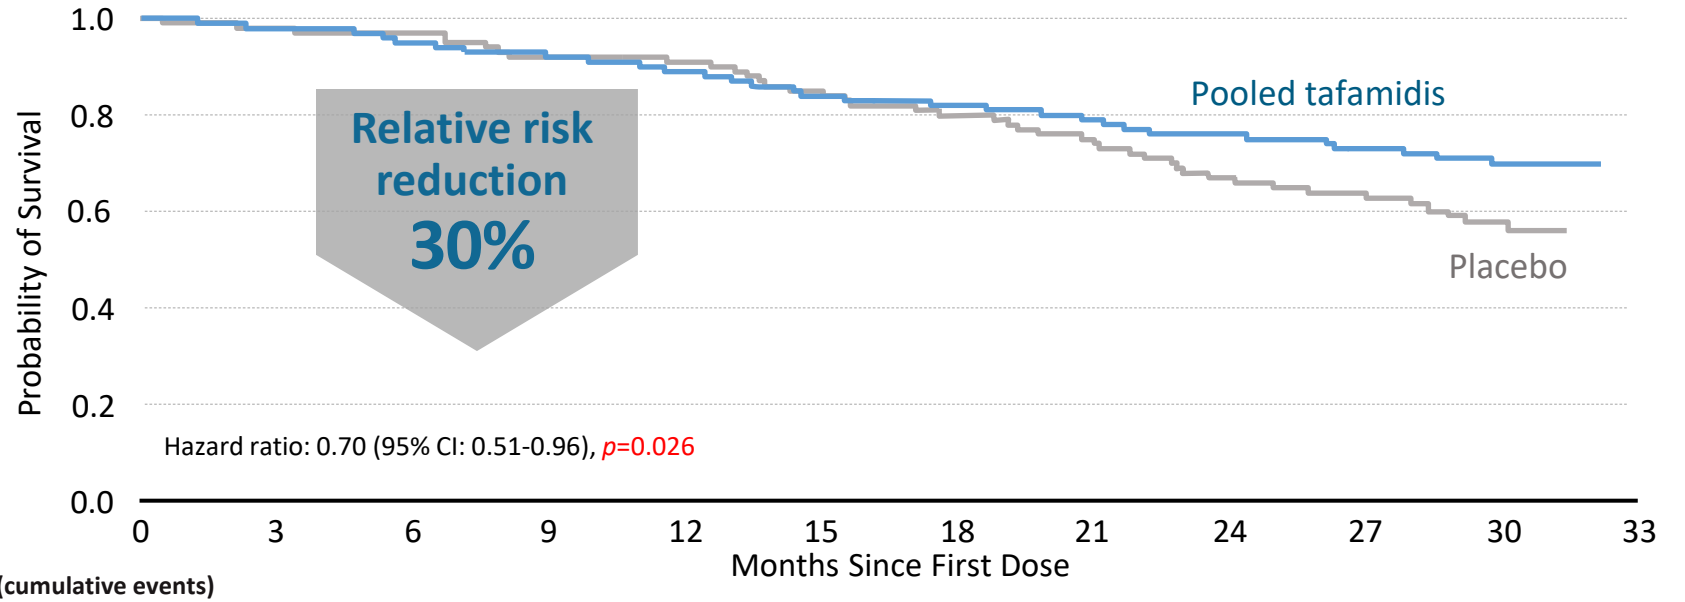
TTR=transthyretin.

1. Maurer MS, et al. *Circ Heart Fail*. 2017;10:e003815. 2. Bulawa CE, et al. *Proc Natl Acad Sci USA*. 2012;109:9629-9634.

*VYNDAMAX Significantly Reduced the Risk of All-Cause Mortality vs Placebo Over 30 Months

Individual Component of the Primary Analysis

All-cause Mortality at Month 30*[1,2]



No. at risk (cumulative events)

Pooled tafamidis	264 (0)	259 (5)	252 (12)	244 (20)	235 (29)	222 (42)	216 (48)	209 (55)	200 (64)	193 (71)	99 (78)	0 (78)
Placebo	177 (0)	173 (4)	171 (6)	163 (14)	161 (16)	150 (27)	141 (36)	131 (46)	118(59)	113(64)	51 (75)	0 (76)

Analysis not adjusted for multiplicity.

Number Needed to Treat: 7.5

~8 patients would need to be treated to prevent 1 death within 30 months.

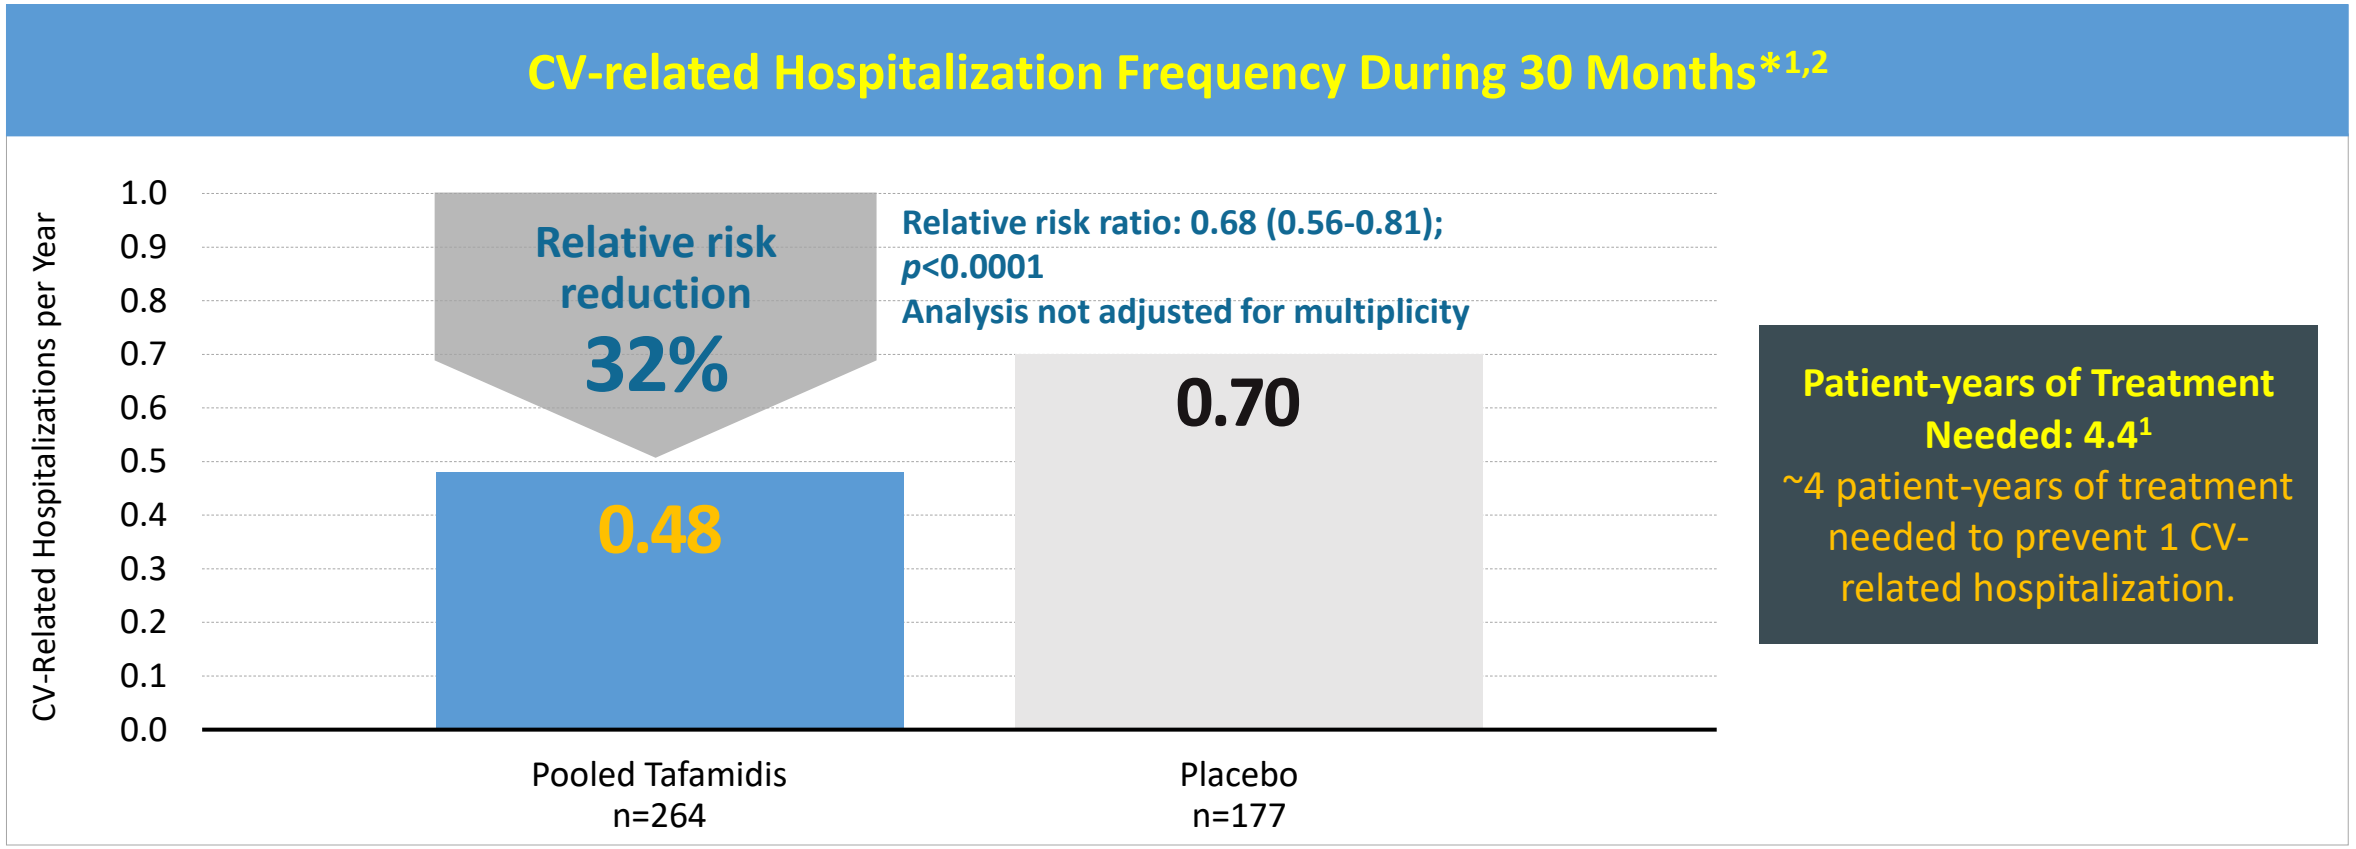
Chart and table adapted from Maurer MS, et al. *N Engl J Med*. 2018;379:1007-1016.

ATTR-CM=transthyretin amyloid cardiomyopathy.

*Heart transplantation, combined heart and liver transplantation, and cardiac mechanical assist device implantation are treated as equivalent to death in this analysis.[1] Analysis not adjusted for multiplicity. The components of the primary analysis, all-cause mortality, and CV-related hospitalizations, were evaluated individually. All-cause mortality was analyzed with the use of a Cox proportional hazards model, with treatment and the stratification factors treated as covariates.

VYNDAMAX Significantly Reduced the Risk of CV-Related Hospitalizations vs Placebo over 30 months[1,2]

Individual Component of the Primary Analysis



.

The components of the primary analysis, all-cause mortality, and CV-related hospitalizations, were evaluated individually. All-cause mortality was analyzed with the use of a Cox proportional hazards model, with treatment and the stratification factors treated as covariates. The CV-related hospitalization analysis was based on a Poisson regression model with treatment, transthyretin (TTR) status (hereditary and wild-type), New York Heart Association (NYHA) baseline class (NYHA classes I and II combined vs NYHA Class III), treatment by *TTR* genotype interaction, and treatment by NYHA baseline classification interaction terms as factors.[1]

CV=cardiovascular; NNT=number needed to treat.

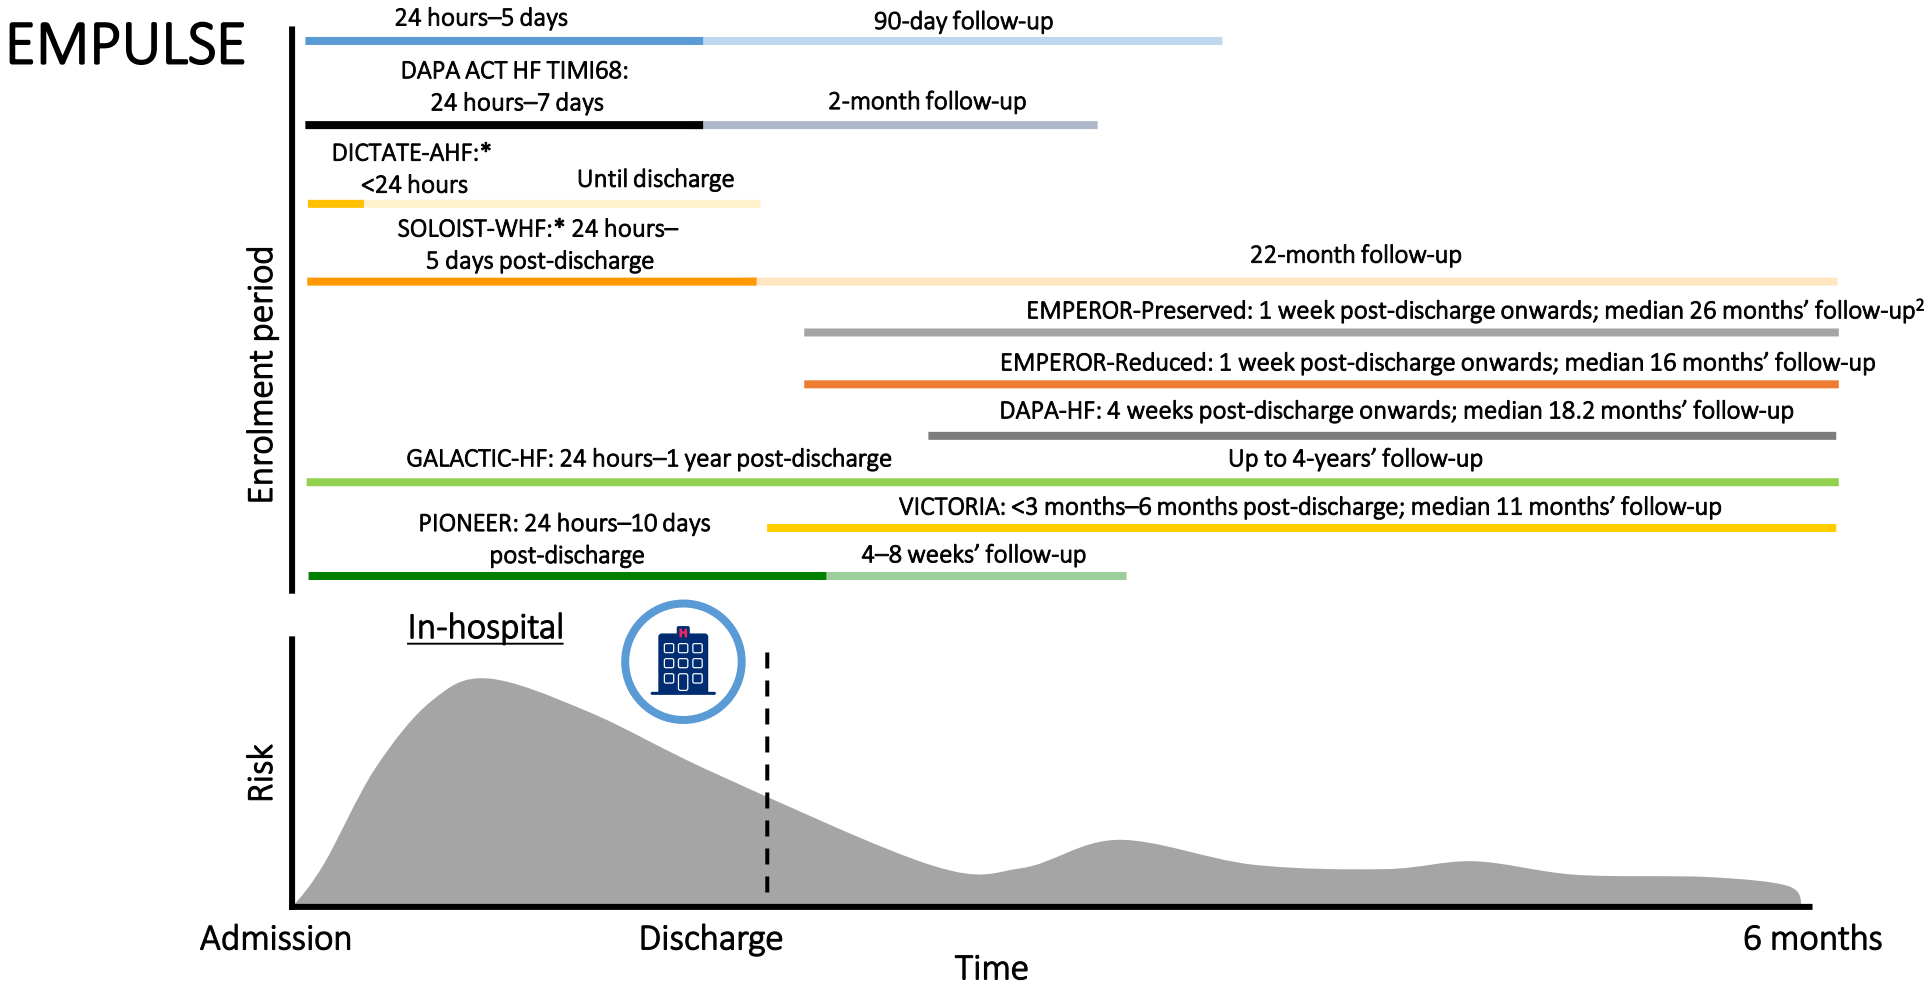
Bone fractures	45 (2·4%)	42 (2·3%)	48 (2·0%)	47 (2·0%)
Lower limb amputation	13 (0·7%)	10 (0·5%)	13 (0·5%)	12 (0·5%)
Fournier's Gangrene	1 (0·1%)	0	0	1 (0·1%)

conclusion

- **The effects of empagliflozin and dapagliflozin on hospitalizations for heart failure were consistent in the two independent trials and suggest that these agents also improve renal outcomes and reduce all-cause and cardiovascular death in patients with HFrEF.**

EMPULSE trial in Acute HF



*Only patients with type 2 diabetes.

1. Adapted from Tromp J *et al. Eur J Heart Fail.* 2021;23:826; 2. Anker S *et al. N Engl J Med.* 2021;385:1451.

EMPULSE: Conclusions

Patients hospitalized for acute HF treated with empagliflozin were **36% more likely to experience a clinical benefit*** versus patients on placebo

The clinical benefits were **consistent in patients with HFrEF or HFpEF**, and **in patients with de novo or decompensated chronic heart failure**

Empagliflozin was **well tolerated**, with overall safety data consistent with previous studies

*Evaluated with a win ratio based on a composite of death, number of HFEs (including HHFs, urgent HF visits and unplanned outpatient visits), time to first HFE and change from baseline in KCCQ-TSS after 90 days of treatment. HF, heart failure; HFE, heart failure event; HHF, hospitalization for heart failure; HFpEF, heart failure with preserved ejection fraction; HFrEF, heart failure with reduced ejection fraction; KCCQ-TSS, Kansas City Cardiomyopathy Questionnaire Total Symptom Score.
